

No Licence is attached to this source (by “source” we mean a compressed eg. tarball or similar archive, not necessary source code). This can have several reasons:

- 1) The source is a combined work, containing many different source packages and the listing of all licences would not be useful (Example: Disk images of Linux Distributions, LiveCDs etc.)
- 2) The source in question does not use a single source-wide licence but is licenced on a file by file basis or even more diverse. This requires close inspection of each file.
- 3) The licencing situation is undetermined. It's believed that the product is “open source”, but there's no clear indication which licence applies.
- 4) The source comes with a commercial licence or EULA which can't be extracted or is copyrighted by itself.
- 5) The source is trivial and not considered copyrightable by its creators. (Example: control files, small patches, configuration files, code examples etc.)
- 6) ...

Note: Sources which include a “unspecified” licence require detailed examination before modifying or integrating them into your product! If in doubt, always consult a lawyer.
